WHAT THIS MEANS FOR YOU

Metric	Best case (2005–2024)	Middle case (2003–2022)	Worst case (2000–2019)
Your total cash invested	\$0	\$0	\$0
Loan repaid (Year 20, age 65)	\$3,735,077 net left	\$2,869,559 net left	\$2,260,789 net left
Annual income from Year 21	\$100,000/yr tax-free	\$100,000/yr tax-free	\$100,000/yr tax-free
Policy value at life expectancy (76)	\$5,812,949	\$4,775,394	\$3,602,963
Cumulative income by age 76	\$1,100,000	\$1,100,000	\$1,100,000
Policy value at age 80	\$6,990,703	\$5,664,465	\$4,165,825

Cumulative income by age 80	\$1,500,000	\$1,500,000	\$1,500,000
Death benefit to heirs at age 76	~\$7–9M (tax-free)	~\$5.5–7M (tax-free)	~\$4–5M (tax-free)
Policy depleted?	No — keeps growing	No — keeps growing	No — keeps growing

BOTTOM LINE (Age 45, \$100k/yr, life expectancy 76): In every historical scenario tested — including the one that started with three straight years of S&P; 500 losses — you collect \$1.1M in tax-free income by your life expectancy at 76, the policy is still worth \$3.6M–\$5.8M, AND your heirs receive that amount as an income-tax-free death benefit. You invested \$0. The lender's money built the entire asset.

S&P; 500 annual price returns (ex-dividends) used from public historical data 2000–2024. Years beyond available data use scenario average as proxy. Policy charges approximated at 1%/yr. Actual IUL charges vary by age and policy year. Death benefit estimates are approximate. All values hypothetical. Not financial advice.
